## AutoCAD 2000i Layer States

Previously available as a similar command in Express Tools, AutoCAD 2000i includes a new feature called Layer States. It's available from the Layer Properties Manager window. Using Layer States, you can save the current layer settings, and restore those settings at a later time. You can also export settings to a .las file, which can be imported into other drawings.

### To save a layer state

- 1] Start the Layer Properties Manager (click the Layer toolbar button, or click **Format** → **Layer**).
- 2] Click the **Save state** button (near the upper right hand corner of the Layer window).
- 3] Enter a name for the new layer state.
- 4] Check the states and properties that you want to be saved. If you're not sure, check them all!
- 5] Click OK.

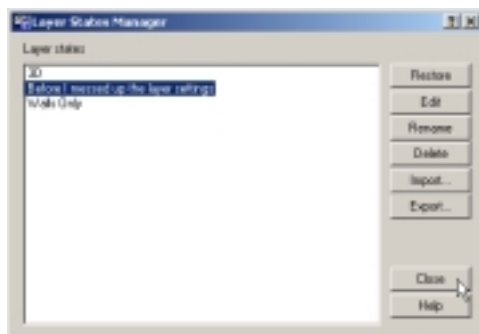

Now you can make changes to layer settings, and later restore them...

### To restore a layer state

- 1] Start the Layer Properties Manager, then click **Restore state**.
- 2] Highlight the desired state name, then click **Restore**.

Using the Restore state button, you can **edit**, **rename** and **delete** layer states. Click **Export** to create a .las file, and you can **Import** a .las file too.

## Relative Xref Paths

So you have a project that includes drawings with attached xrefs. You have a CD burned, and the CD has the same folder paths, but the drawings don't load their xrefs correctly, since the CD drive letter is say E:, and original paths started with P:. Using relative paths, we can fix this while the drawings are still on P:, and prevent xref load problems later.

your xrefs will load now and later,  
even if the project folder  
is moved to a CD or other drive

Here's an example - We open P:\GRTEV433\16\ARCH\A1-PLAN.dwg, and click Insert → Xref Manager. We find it has an attached xref:

P:\GRTEV433\16\BASES\xfloor.dwg

Notice the xref path. In the Xref Manager window, highlight XFLOOR, and in the **Xref Found At** box, we change the path to:

..\BASES\xfloor.dwg

then click Save Path, and OK.

Notice especially the two dots before \BASES. Going back to the days of DOS operating system, the two dots indicate to back-up one folder. So, our new path is saying, from the folder where I currently am (in the ARCH folder), go back a folder, then go to \BASES\xfloor.dwg.

Try it on your files! Please call if you have questions.

## New Printer

Have you seen our new HP 5000 Color Printer? Located downstairs in Micrographics, it will handle up to 60" wide paper, 1200 x 600 dpi, has lots of ram, and it's fast! Contact Micrographics for paper availability.

### Connect To It

Click Start → Settings → Printers, Add Printer. Go to **Microsoft Windows Network**, then **Denver** domain, then the server **DenPlotStation**. Select either the **HP5000Color** or **HP5000ColorPostscript** printer, then click **Next** until you're done.

### What is the difference between Postscript and non-Postscript?

Use the Postscript version for applications that print Postscript, for example Adobe Illustrator and PhotoShop. For applications like Microsoft Word and AutoCAD, use the non-Postscript version (the HP5000Color).

### Accounting

Tom Fair asks everyone to please fill out a work order when using this printer.

With features like photo  
quality 1200 x 600 dpi  
60" x 600" max size  
and 256 megs ram,  
this printer rocks!
